CHAPTER 3 OUTLINE

- 3.1 Consumer Preferences
- 3.2 Budget Constraints
- 3.3 Consumer Choice
- 3.4 Revealed Preference
- 3.5 Marginal Utility and Consumer Choice
- 3.6 Cost-of-Living Indexes

Consumer Behavior

3 of 37

• theory of consumer behavior Description of how consumers allocate incomes among different goods and services to maximize their well-being.

Consumer behavior is best understood in three distinct steps:

- 1. Consumer preferences
- 2. Budget constraints
- 3. Consumer choices

Market Baskets

• market basket (or bundle) List with specific quantities of one or more goods.

TABLE 3.1 Alternative Market Baskets					
Market Basket	Units of Food	Units of Clothing			
А	20	30			
В	10	50			
D	40	20			
E	30	40			
G	10	20			
Н	10	40			

To explain the theory of consumer behavior, we will ask whether consumers *prefer* one market basket to another.

Some Basic Assumptions about Preferences

1. **Completeness:** Preferences are assumed to be *complete*. In other words, consumers can compare and rank all possible baskets. Thus, for any two market baskets *A* and *B*, a consumer will prefer *A* to *B*, will prefer *B* to *A*, or will be indifferent between the two. By *indifferent* we mean that a person will be equally satisfied with either basket.

Note that these preferences ignore costs. A consumer might prefer steak to hamburger but buy hamburger because it is cheaper.

Some Basic Assumptions about Preferences

- 2. Transitivity: Preferences are *transitive*. Transitivity means that if a consumer prefers basket *A* to basket *B* and basket *B* to basket *C*, then the consumer also prefers *A* to *C*. Transitivity is normally regarded as necessary for consumer consistency.
- **3. More is better than less:** Goods are assumed to be desirable—i.e., to be good. Consequently, consumers always prefer more of any good to less. In addition, consumers are never satisfied or satiated; more is always better, even if just a little better. This assumption is made for pedagogic reasons; namely, it simplifies the graphical analysis. Of course, some goods, such as air pollution, may be undesirable, and consumers will always prefer less. We ignore these "bads" in the context of our immediate discussion.

Indifference curves

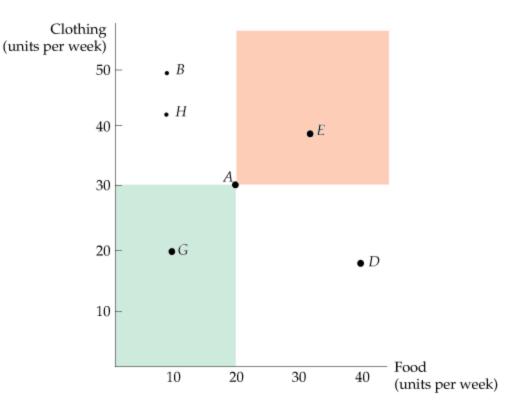

Figure 3.1

Describing Individual Preferences

Because more of each good is preferred to less, we can compare market baskets in the shaded areas. Basket *A* is clearly preferred to basket *G*, while *E* is clearly preferred to *A*.

However, A cannot be compared with B, D, or H without additional information.

Indifference curves

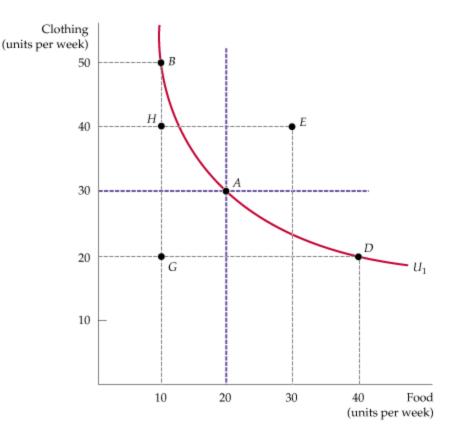

• **indifference curve** Curve representing all combinations of market baskets that provide a consumer with the same level of satisfaction.

Figure 3.2

An Indifference Curve

The indifference curve U_1 that passes through market basket A shows all baskets that give the consumer the same level of satisfaction as does market basket A; these include baskets B and D.

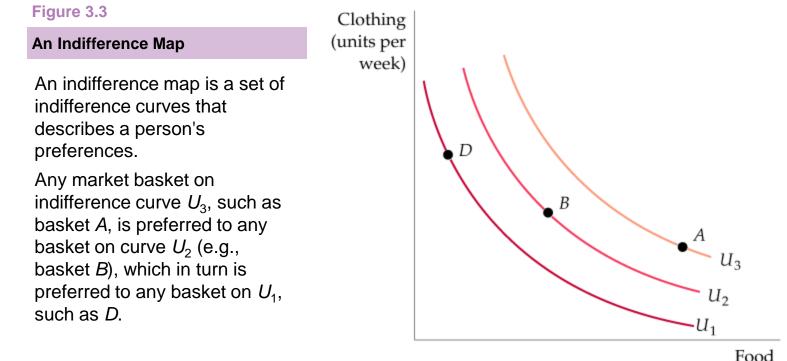

Our consumer prefers basket E, which lies above U_1 , to A, but prefers A to H or G, which lie below U_1 .

Indifference Maps

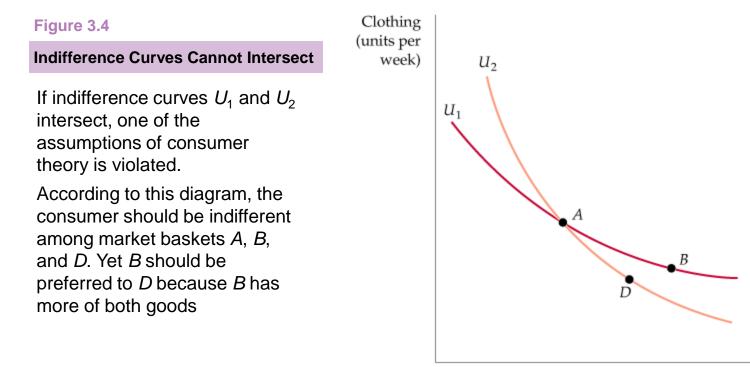

• **indifference map** Graph containing a set of indifference curves showing the market baskets among which a consumer is indifferent.

⁽units per week)

Indifference Maps

Food (units per week)

The Marginal Rate of Substitution

• marginal rate of substitution Maximum amount of a good that a consumer is willing to give up in order to obtain one additional unit of another good.

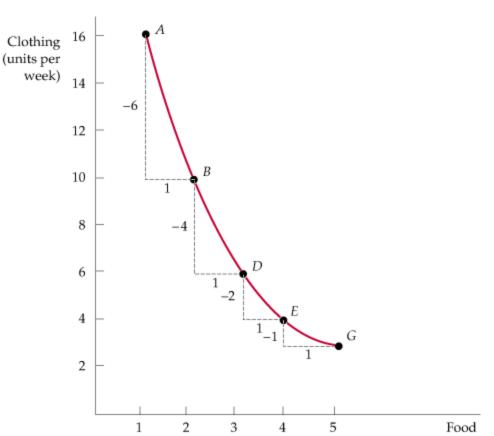

Figure 3.5

The Marginal Rate of Substitution

The magnitude of the slope of an indifference curve measures the consumer's marginal rate of substitution (MRS) between two goods.

In this figure, the MRS between clothing (*C*) and food (*F*) falls from 6 (between A and *B*) to 4 (between *B* and *D*) to 2 (between *D* and *E*) to 1 (between *E* and *G*).

Convexity The decline in the MRS reflects a **diminishing marginal rate of substitution**. When the MRS diminishes along an indifference curve, the curve is convex.

⁽units per week)

Perfect Substitutes and Perfect Complements

- **perfect substitutes** Two goods for which the marginal rate of substitution of one for the other is a constant.
- **perfect complements** Two goods for which the MRS is infinite; the indifference curves are shaped as right angles.

Bads

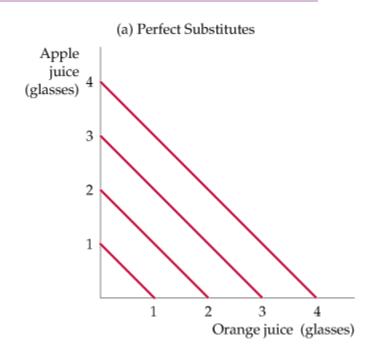

• **bad** Good for which less is preferred rather than more.

Perfect Substitutes and Perfect Complements

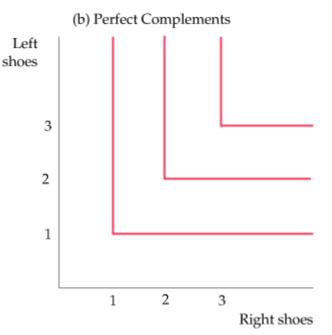

Figure 3.6

Perfect Substitutes and Perfect Complements

In (a), Bob views orange juice and apple juice as perfect substitutes: He is always indifferent between a glass of one and a glass of the other.

In (b), Jane views left shoes and right shoes as perfect complements: An additional left shoe gives her no extra satisfaction unless she also obtains the matching right shoe.

EXAMPLE 3.1

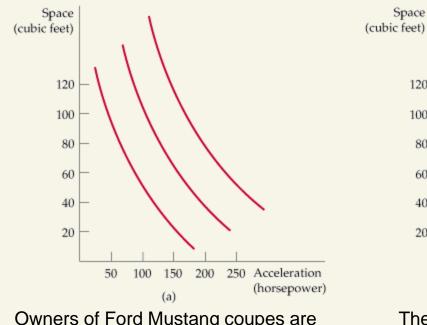

Designing New Automobiles (I)

Figure 3.7

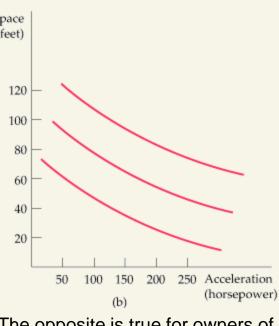

Preferences for Automobile Attributes

Preferences for automobile attributes can be described by indifference curves. Each curve shows the combination of acceleration and interior space that give the same satisfaction.

Owners of Ford Mustang coupes are willing to give up considerable interior space for additional acceleration.

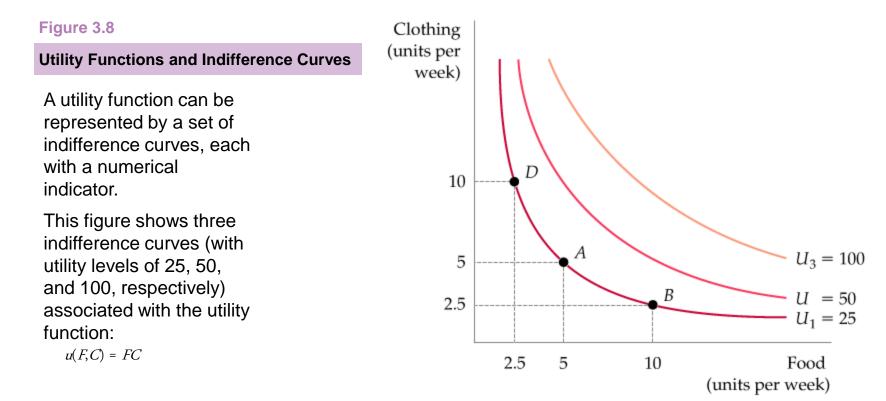

The opposite is true for owners of Ford Explorers. They prefer interior space to acceleration.

Utility and Utility Functions

- **utility** Numerical score representing the satisfaction that a consumer gets from a given market basket.
- **utility function** Formula that assigns a level of utility to individual market baskets.

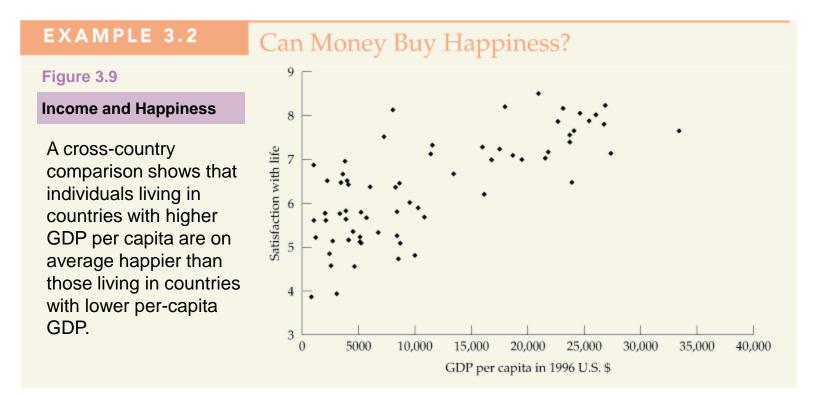

Copyright © 2009 Pearson Education, Inc. Publishing as Prentice Hall • Microeconomics • Pindyck/Rubinfeld, 8e.

Ordinal versus Cardinal Utility

- ordinal utility function Utility function that generates a ranking of market baskets in order of most to least preferred.
- cardinal utility function Utility function describing by how much one market basket is preferred to another.

3.2 BUDGET CONSTRAINTS

The Budget Line

- **budget constraints** Constraints that consumers face as a result of limited incomes.
- **budget line** All combinations of goods for which the total amount of money spent is equal to income.

TABLE 3.2 Market Baskets and the Budget Line						
Market Basket	Food (<i>F</i>)	Clothing (C)	Total Spending			
A	0	40	\$80			
В	20	30	\$80			
D	40	20	\$80			
E	60	10	\$80			
G	80	0	\$80

Chapter 3: Consumer Behavior

3.2 BUDGET CONSTRAINTS

The Budget Line

Figure 3.10

A Budget Line

A budget line describes the combinations of goods that can be purchased given the consumer's income and the prices of the goods.

Line *AG* (which passes through points *B*, *D*, and *E*) shows the budget associated with an income of \$80, a price of food of $P_F = 1 per unit, and a price of clothing of $P_C =$ \$2 per unit.

The slope of the budget line (measured between points *B* and *D*) is $-P_P/P_C = -10/20 = -1/2$.

per week) $(I/P_{\rm C}) = 40$ Budget Line F + 2C =\$80 30 В 10 Slope $\Delta C / \Delta F = -\frac{1}{2} = -P_F / P_C$ D 20 20 Ε 10 G Food 40 60 $80 = (I/P_{\rm F})$ 0 20

The Effects of Changes in Income and Prices

Figure 3.11

BUDGET CONSTRAINTS 3.2

The Effects of Changes in Income and Prices

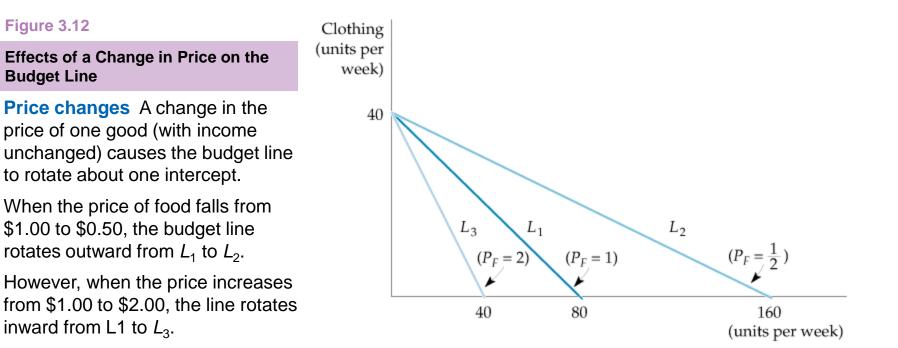

Figure 3.12

Budget Line

3.3 CONSUMER CHOICE

The maximizing market basket must satisfy two conditions:

- 1. It must be located on the budget line.
- It must give the consumer the most preferred combination of goods and services.

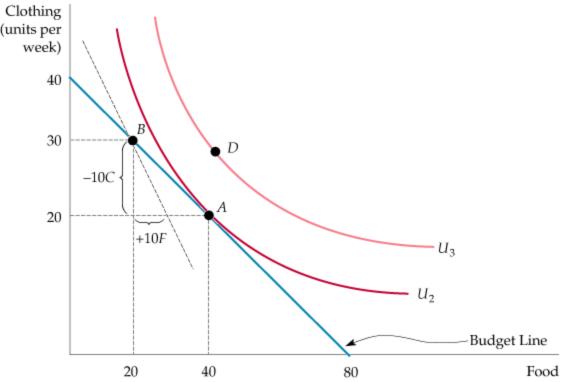

Figure 3.13

Maximizing Consumer Satisfaction

A consumer maximizes satisfaction by choosing market basket A. At this point, the budget line and indifference curve U_2 are tangent.

No higher level of satisfaction (e.g., market basket *D*) can be attained.

At *A*, the point of maximization, the MRS between the two goods equals the price ratio. At *B*, however, because the MRS [-(-10/10) = 1] is greater than the price ratio (1/2), satisfaction is not maximized.

(units per week)

21 of 37

Satisfaction is maximized (given the budget constraint) at the point where MRS = P_P/P_C .

- marginal benefit Benefit from the consumption of one additional unit of a good.
- marginal cost Cost of one additional unit of a good.

Using these definitions, we can then say that satisfaction is maximized when the marginal benefit—the benefit associated with the consumption of one additional unit of food—is equal to the marginal cost—the cost of the additional unit of food. The marginal benefit is measured by the MRS.

The consumers in (a) are willing to trade off a considerable amount of interior space for some additional acceleration. Given a budget constraint, they will choose a car that emphasizes acceleration. The opposite is true for consumers in (b).

Consumer Behavior

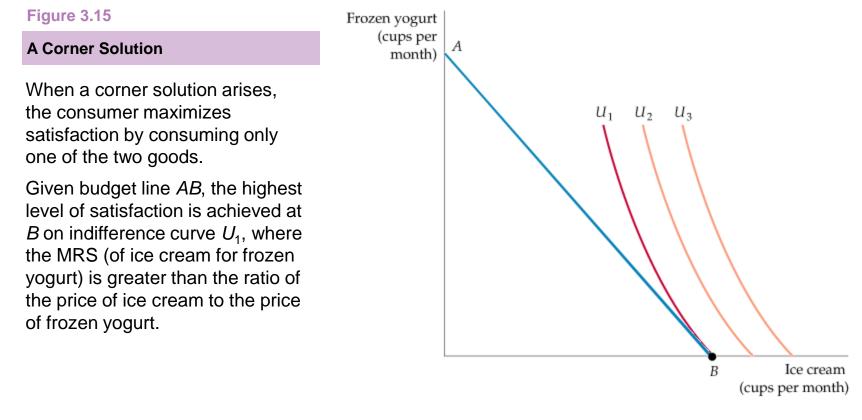

Chapter 3:

CONSUMER CHOICE

Corner Solutions

3.3

• corner solution Situation in which the marginal rate of substitution for one good in a chosen market basket is not equal to the slope of the budget line.

CONSUMER CHOICE 3.3 EXAMPLE 3.4 A College Trust Fund Figure 3.16 Other consumption A College Trust Fund (\$) When given a college trust fund that must be spent on education, the student moves from A to B, a corner solution. pIf, however, the trust fund -.U₃ could be spent on other U_2 consumption as well as education, the student would be better off at C. U_1

Q

Education (\$)

3.4 **REVEALED PREFERENCE**

If a consumer chooses one market basket over another, and if the chosen market basket is more expensive than the alternative, then the consumer must prefer the chosen market basket.

Figure 3.17

Revealed Preference: Two Budget Lines

If an individual facing budget line l_1 chose market basket A rather than market basket B, A is revealed to be preferred to *B*.

Likewise, the individual facing budget line I_2 chooses market basket B, which is then revealed to be preferred to market basket D.

Whereas *A* is preferred to all market baskets in the green-shaded area, all baskets in the pink-shaded area are preferred to A.

Food (units per month)

Consumer Behavior

Chapter 3:

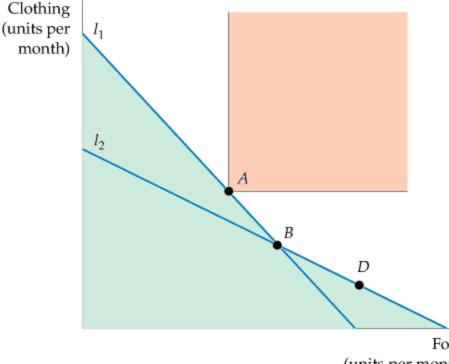

Figure 3.18

Consumer Behavior

Chapter 3:

3.4

Revealed Preference: Four Budget Lines

Facing budget line I_3 the individual chooses *E*, which is revealed to be preferred to *A* (because *A* could have been chosen).

Likewise, facing line I_4 , the individual chooses *G* which is also revealed to be preferred to *A*.

Whereas *A* is preferred to all market baskets in the green-shaded area, all market baskets in the pink-shaded area are preferred to *A*.

REVEALED PREFERENCE

3.4 REVEALED PREFERENCE

EXAMPLE 3.5

Revealed Preference for Recreation

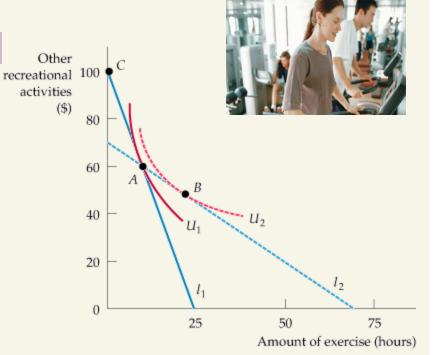

Figure 3.19

Revealed Preference for Recreation

When facing budget line I_1 , an individual chooses to use a health club for 10 hours per week at point *A*.

When the fees are altered, she faces budget line I_2 .

She is then made better off because market basket *A* can still be purchased, as can market basket *B*, which lies on a higher indifference curve.

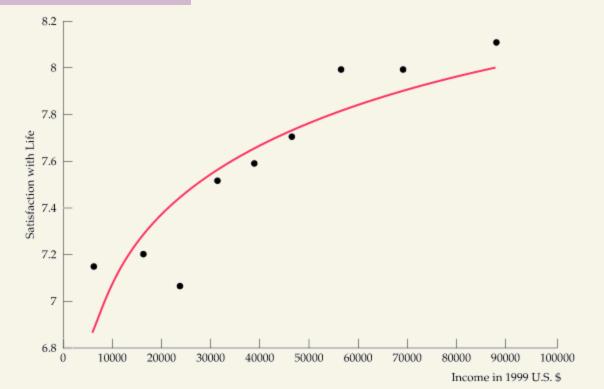

- marginal utility (MU) Additional satisfaction obtained from consuming one additional unit of a good.
- **diminishing marginal utility** Principle that as more of a good is consumed, the consumption of additional amounts will yield smaller additions to utility.

 $0 = MU_{F}(\Delta F) + MU_{C}(\Delta C)$ $-(\Delta C/\Delta F) = MU_{F} + MU_{C}(\Delta C)$ $MRS = MU_{F}/MU_{C}$ (3.5) $MRS = P_{F}/P_{C}$ $MU_{F}/MU_{C} = P_{F}/P_{C}$ $MU_{F}/P_{F} = MU_{C}/P_{C}$ (3.7)

• equal marginal principle Principle that utility is maximized when the consumer has equalized the marginal utility per dollar of expenditure across all goods.

Figure 3.20

A comparison of mean levels of satisfaction with life across income classes in the United States shows that happiness increases with income, but at a diminishing rate.

EXAMPLE 3.7

Gasoline Rationing

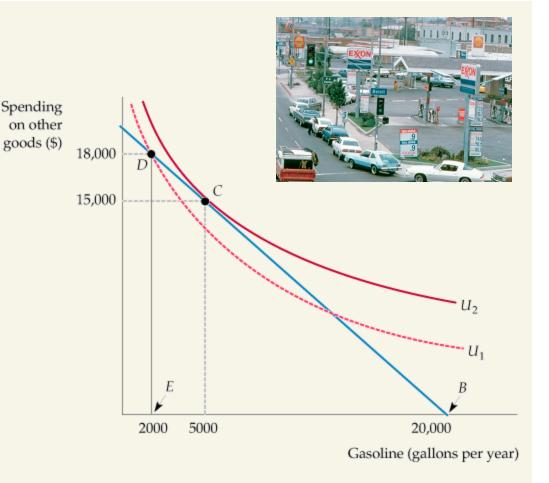

Figure 3.21

Inefficiency of Gasoline Rationing

When a good is rationed, less is available than consumers would like to buy. Consumers may be worse off. Without gasoline rationing, up to 20,000 gallons of gasoline are available for consumption (at point *B*).

The consumer chooses point C on indifference curve U_2 , consuming 5000 gallons of gasoline.

However, with a limit of 2000 gallons of gasoline under rationing (at point *E*), the consumer moves to *D* on the lower indifference curve U_1 .

EXAMPLE 3.7

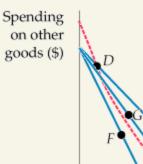

Gasoline Rationing (continued)

Figure 3.22

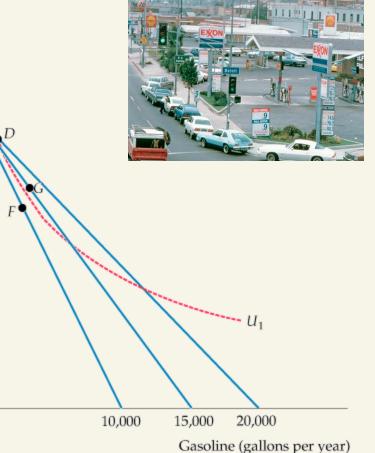

Comparing Gasoline Rationing to the Free Market

If the price of gasoline in a competitive market is \$2.00 per gallon and the maximum consumption of gasoline is 10,000 gallons per year, the woman is better off under rationing (which holds the price at \$1.00 per gallon), since she chooses the market basket at point *F*, which lies below indifference curve U_1 (the level of utility achieved under rationing).

However, she would prefer a free market if the competitive price were \$1.50 per gallon, since she would select market basket G, which lies above indifference curve U_1 .

0

• **cost-of-living index** Ratio of the present cost of a typical bundle of consumer goods and services compared with the cost during a base period.

Ideal Cost-of-Living Index

• ideal cost-of-living index Cost of attaining a given level of utility at current prices relative to the cost of attaining the same utility at base-year prices.

3.6 COST-OF-LIVING INDEXES

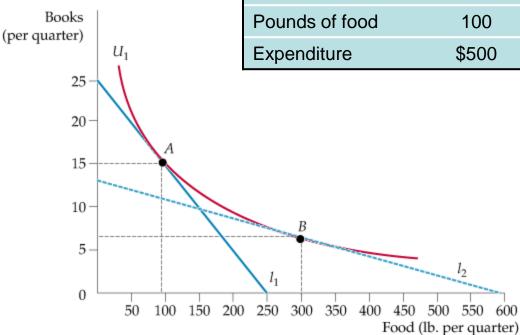

Ideal Cost-of-Living Index

TABLE 3.3 Ideal Cost-of-Living Index				
	1995 (<i>Sarah</i>)	2005 (<i>Rachel</i>)		
Price of books	\$20/book	\$100/bk		
Number of books	15	6		
Price of food	\$2.00/lb.	\$2.20/lb.		
Pounds of food	100	300		
Expenditure	\$500	\$1260		

Figure 3.23

Cost-of-Living Indexes

The initial budget constraint facing Sarah in 1995 is given by line l_1 ; her utility-maximizing combination of food and books is at point *A* on indifference curve U_1 .

Rachel requires a budget sufficient to purchase the foodbook consumption bundle given by point *B* on line l_2 (and tangent to indifference curve U_1).

3.6 **COST-OF-LIVING INDEXES**

Ideal Cost-of-Living Index

	TABLE 3.3 Ideal Cost-of-Living Index

600

Figure 3.23

A price index, which represents the cost of buying bundle A at current prices relative to the cost of bundle A at base-year prices, overstates the ideal costof-living index.

3.6 COST-OF-LIVING INDEXES

Laspeyres Index

• Laspeyres price index Amount of money at current year prices that an individual requires to purchase a bundle of goods and services chosen in a base year divided by the cost of purchasing the same bundle at base-year prices.

Comparing Ideal Cost-of-Living and Laspeyres Indexes

The Laspeyres index overcompensates Rachel for the higher cost of living, and the Laspeyres cost-of-living index is, therefore, greater than the ideal cost-of-living index.

Paasche Index

• **Paasche index** Amount of money at current-year prices that an individual requires to purchase a current bundle of goods and services divided by the cost of purchasing the same bundle in a base year.

Comparing the Laspeyres and Paasche Indexes Just as the Laspeyres index will overstate the ideal cost of living, the Paasche will understate it because it assumes that the individual will buy the current year bundle in the base period.

3.6 COST-OF-LIVING INDEXES

• **fixed-weight index** Cost-of-living index in which the quantities of goods and services remain unchanged.

Price Indexes in the United States: Chain Weighting

• chain-weighted price index Cost-of-living index that accounts for changes in quantities of goods and services.

EXAMPLE 3.8 The Bias in the CPI

A commission chaired by Stanford University professor Michael Boskin concluded that the CPI overstated inflation by approximately 1.1 percentage points—a significant amount given the relatively low rate of inflation in the United States in recent years.

Approximately 0.4 percentage points of the 1.1-percentage-point bias was due to the failure of the Laspeyres price index to account for changes in the current year mix of consumption of the products in the base-year bundle.
